Hopf algebras: an introduction,

Monographs and Textbooks in Pure and Applied Mathematics 235,

Marcel Dekker, 2001

TONNY ALBERT SPRINGER,

Linear algebraic groups,

Progress in Mathematics, Birkhäuser, 2nd Edition 1998

In this presentation,

\mathbb{K} denotes a field, and

all tensor products are **over** \mathbb{K} , e.g., $V \otimes W = V \otimes_{\mathbb{K}} W$.

All rings and associative algebras are assumed to have **identity**.

Chapter 1.

Basic Definitions, Notions, and Examples

Definition of (associative) algebras over \mathbb{K}

There are many equivalent definitions for an (associative) algebra

A over \mathbb{K} :

- ▶ A is a ring together with a ring homomorphism $\mathbb{K} \rightarrow A$ whose image is in the center of A .
- ▶ A is a \mathbb{K} -vector space together with a \mathbb{K} -bilinear operation $A \times A \rightarrow A$ such that $(xy)z = x(yz)$, $\forall x, y, z \in A$, in which A has multiplicative identity.

⋮

What is a 'good' definition of algebras for us?

Among these equivalent ones we adopt the following (next page)

definition of algebras over \mathbb{K} because it can be easily dualizable.

Definition of (associative) algebras over \mathbb{K} , continued

A is called an algebra over \mathbb{K} if

A is a \mathbb{K} -vector space together with two \mathbb{K} -linear maps

$M : A \otimes A \rightarrow A$ and $u : \mathbb{K} \rightarrow A$ such that

$$\begin{array}{ccc} A \otimes A \otimes A & \xrightarrow{\text{Id} \otimes M} & A \otimes A \\ M \otimes \text{Id} \downarrow & & \downarrow M \\ A \otimes A & \xrightarrow{M} & A \end{array}$$

$$\begin{array}{ccc} A \otimes A & \xleftarrow{u \otimes \text{Id}} & \mathbb{K} \otimes A \\ \text{Id} \otimes u \uparrow & \searrow M & \downarrow \simeq \\ A \otimes \mathbb{K} & \xrightarrow{\simeq} & A \end{array}$$

commute, where $\text{Id} : A \rightarrow A$ is the identity map.

We call M a *product* and u a *unit*, because

$xy := M(x \otimes y)$ and $1_A := u(1_{\mathbb{K}})$ play role as a usual multiplication and identity in A .

Dualizing

By **reversing** all the directions of the arrows,

we obtain the notion of coalgebras over \mathbb{K} ...

Definition of coalgebras (cogebbras) over \mathbb{K}

A coalgebra C over \mathbb{K} is a \mathbb{K} -vector space together with two \mathbb{K} -linear maps $\Delta : C \rightarrow C \otimes C$ and $\epsilon : C \rightarrow \mathbb{K}$ such that

$$\begin{array}{ccc} C \otimes C \otimes C & \xleftarrow{\text{Id} \otimes \Delta} & C \otimes C \\ \Delta \otimes \text{Id} \uparrow & & \uparrow \Delta \\ C \otimes C & \xleftarrow{\Delta} & C \end{array}$$

$$\begin{array}{ccc} C \otimes C & \xrightarrow{\epsilon \otimes \text{Id}} & \mathbb{K} \otimes C \\ \text{Id} \otimes \epsilon \downarrow & \swarrow \Delta & \downarrow \simeq \\ C \otimes \mathbb{K} & \xrightarrow{\simeq} & C \end{array}$$

commute.

We call Δ a *coproduct* and ϵ a *counit*.

The identity $(\text{Id} \otimes \Delta) \circ \Delta = (\Delta \otimes \text{Id}) \circ \Delta$ from the first diagram is referred to as the “*coassociativity*”.

Commutativity and Cocommutativity

- ▶ An algebra (A, M, u) is said to be *commutative* if

$$\begin{array}{ccc} A \otimes A & \xrightarrow{x \otimes y \mapsto y \otimes x} & A \otimes A \\ & \searrow M & \swarrow M \\ & A & \end{array}$$

commutes.

- ▶ A coalgebra (C, Δ, ϵ) is said to be *cocommutative* if

$$\begin{array}{ccc} C \otimes C & \xrightarrow{x \otimes y \mapsto y \otimes x} & C \otimes C \\ & \swarrow \Delta & \searrow \Delta \\ & C & \end{array}$$

commutes.

Examples of coalgebras (I)

Ex. 1. 'Group-like coalgebra'

Let S be a set and V a \mathbb{K} -space with the set S as basis.

Define $\Delta : V \rightarrow V \otimes V$ and $\epsilon : V \rightarrow \mathbb{K}$ by

$$\Delta(s) := s \otimes s \text{ and } \epsilon(s) := 1, \forall s \in S.$$

Then V becomes a (cocommutative) coalgebra over \mathbb{K} .

Ex. 2. 'Devided power coalgebra'

Let D be a \mathbb{K} -vector space with a basis $\{d_m | m = 0, 1, 2, \dots\}$.

Define $\Delta : D \rightarrow D \otimes D$ and $\epsilon : D \rightarrow \mathbb{K}$ by

$$\Delta(d_m) := \sum_{k=0}^m d_k \otimes d_{m-k} \text{ and } \epsilon(d_m) := \delta_{0,m}, \quad \forall m = 0, 1, 2, \dots$$

Then D becomes a (cocommutative) coalgebra.

Examples of coalgebras (II)

Ex. 3. 'Matrix coalgebra'

Let $\{e_{ij}\}_{1 \leq i, j \leq n}$ be the canonical basis for $M := \text{Mat}_n(\mathbb{K})$.

Then M is a coalgebra if $\Delta : M \rightarrow M \otimes M$ and $\epsilon : M \rightarrow \mathbb{K}$ are

$$\Delta(e_{ij}) := \sum_{k=1}^n e_{ik} \otimes e_{kj} \quad \text{and} \quad \epsilon(e_{ij}) := \delta_{ij}.$$

Ex. 4. 'Incidence coalgebra'

Let (P, \leq) be a **locally finite** partially ordered set, i.e.,

for any $x, y \in P$ with $x \leq y$, the set $\{z \mid x \leq z \leq y\}$ is finite.

If V is a \mathbb{K} -vector space with $\{(x, y) \in P \times P \mid x \leq y\}$ as basis,

$$\Delta((x, y)) := \sum_{x \leq z \leq y} (x, z) \otimes (z, y), \quad \text{and} \quad \epsilon((x, y)) := \delta_{x, y},$$

then V becomes a coalgebra.

Morphisms of algebras and coalgebras

- ▶ A \mathbb{K} -linear map $f : A \rightarrow B$ of algebras is a *morphism* if

$$\begin{array}{ccc} A \otimes A & \xrightarrow{f \otimes f} & B \otimes B \\ M_A \downarrow & & \downarrow M_B \\ A & \xrightarrow{f} & B \end{array}$$

$$\begin{array}{ccc} A & \xrightarrow{f} & B \\ u_A \swarrow & & \searrow u_B \\ & \mathbb{K} & \end{array}$$

commute.

- ▶ A \mathbb{K} -linear map $g : C \rightarrow D$ of coalgebras is a *morphism* if

$$\begin{array}{ccc} C & \xrightarrow{g} & D \\ \Delta_C \downarrow & & \downarrow \Delta_D \\ C \otimes C & \xrightarrow{g \otimes g} & D \otimes D \end{array}$$

$$\begin{array}{ccc} C & \xrightarrow{g} & D \\ \epsilon_C \swarrow & & \searrow \epsilon_D \\ & \mathbb{K} & \end{array}$$

commute.

Generalized associativity

- ▶ In algebra A , we know the “generalized associativity”, e.g.,

$$(ab)((cd)((ef)g)) = a(b(((cd)e)(fg))) \quad \forall a, b, c, d, e, f, g \in A.$$

Systemically, we can think of it as following.

In algebra (A, M, u) , put $M^1 := M$ and define recursively

$$M^n : \underbrace{A \otimes \cdots \otimes A}_{n+1 \text{ times}} \rightarrow A \text{ by } M^n := M^{n-1} \circ (M \otimes \underbrace{\text{Id} \otimes \cdots \otimes \text{Id}}_{n-1 \text{ times}}).$$

Then we have “*generalized associativity*”:

For any $n \geq 2$, $k \in \{1, \dots, n-1\}$, and $p \in \{0, \dots, n-k\}$,

$$M^n = M^{n-k} \circ (\underbrace{\text{Id} \otimes \cdots \otimes \text{Id}}_{p \text{ times}} \otimes M^k \otimes \underbrace{\text{Id} \otimes \cdots \otimes \text{Id}}_{n-k-p \text{ times}}) \text{ holds.}$$

Generalized coassociativity

- In coalgebra (C, Δ, ϵ) , put $\Delta^1 := \Delta$ and define recursively
- $$\Delta^n : C \rightarrow \underbrace{C \otimes \cdots \otimes C}_{n+1 \text{ times}} \text{ by } \Delta^n := (\Delta \otimes \underbrace{\text{Id} \otimes \cdots \otimes \text{Id}}_{n-1 \text{ times}}) \circ \Delta^{n-1}.$$

Then we have “*generalized coassociativity*”:

For any $n \geq 2$, $k \in \{1, \dots, n-1\}$, and $p \in \{0, \dots, n-k\}$,

$$\Delta^n = (\underbrace{\text{Id} \otimes \cdots \otimes \text{Id}}_{p \text{ times}} \otimes \Delta^k \otimes \underbrace{\text{Id} \otimes \cdots \otimes \text{Id}}_{n-k-p \text{ times}}) \circ \Delta^{n-k} \text{ holds.}$$

Product vs Coproduct

- ▶ We can view a product map as “law of composition”, i.e.,

$$z := xy = M(x \otimes y).$$

The resulting quantity $z = xy$ is more simple than x and y in the sense that the number of quantities decreases.

- ▶ However, a coproduct map is a “law of decomposition”, i.e.,

$$\Delta(x) = \sum_{i,j} x_{1i} \otimes x_{2j}.$$

Usually, Δ produces lots of resulting quantities x_{1i} and x_{2j} , and hence we need many summation indicies for them.

The sigma notation (a.k.a. SWEEDLER notation)

“**WARNING!!** The notation introduced in this section plays a key role in the sequel...”

– M. E. SWEEDLER in his book 'Hopf algebras', Section 1.2.

For coproduct Δ or generalized coproduct Δ^n , the sigma notation just *suppresses summation indicies* of resulting quantities.

For instance, if

$$\Delta(x) = \sum_{i,j} x_{1i} \otimes x_{2j} \quad \text{and} \quad \Delta^3(x) = \sum_{i,j,k,\ell} x_{1i} \otimes x_{2j} \otimes x_{3k} \otimes x_{4\ell},$$

then the sigma notation suggests to write the above equations as

$$\Delta(x) = \sum x_1 \otimes x_2 \quad \text{and} \quad \Delta^3(x) = \sum x_1 \otimes x_2 \otimes x_3 \otimes x_4.$$

Examples for use of the sigma notation

Let (C, Δ, ϵ) be a coalgebra and $x \in C$.

Ex. 1. The **coassociativity** $(\text{Id} \otimes \Delta) \circ \Delta = (\Delta \otimes \text{Id}) \circ \Delta = \Delta^2$ is

$$\sum x_1 \otimes (x_2)_1 \otimes (x_2)_2 = \sum (x_1)_1 \otimes (x_1)_2 \otimes x_2 = \sum x_1 \otimes x_2 \otimes x_3.$$

Ex. 2. The defining identity of the **counit** ϵ is

$$\sum \epsilon(x_1) \otimes x_2 = x = \sum x_1 \otimes \epsilon(x_2).$$

Ex. 3. A \mathbb{K} -linear map $g : C \rightarrow D$ is a **coalgebra morphism** iff

$$\sum g(x_1) \otimes g(x_2) = \sum g(x)_1 \otimes g(x)_2 \quad \text{and} \quad \epsilon_C(x) = \epsilon_D(g(x)).$$

Warm up practice

If (C, Δ, ϵ) be a coalgebra, can you verify the following identities?

Exer. 1. $\sum \epsilon(x_2) \otimes \Delta(x_1) = \Delta(x).$

Exer. 2. $\sum \Delta(x_2) \otimes \epsilon(x_1) = \Delta(x).$

Exer. 3. $\sum x_1 \otimes \epsilon(x_3) \otimes x_2 = \Delta(x).$

Exer. 4. $\sum x_1 \otimes x_3 \otimes \epsilon(x_2) = \Delta(x).$

Exer. 5. $\sum \epsilon(x_1) \otimes x_3 \otimes x_2 = \sum x_2 \otimes x_1.$

Exer. 6. $\sum \epsilon(x_1) \otimes \epsilon(x_3) \otimes x_2 = x.$

Computation rule using the sigma notation

(C, Δ, ϵ) : a coalgebra over \mathbb{K}

$f : \underbrace{C \otimes \cdots \otimes C}_{n+1 \text{ times}} \rightarrow C$: a \mathbb{K} -linear map

$\bar{f} : C \rightarrow C$: the composition map $C \xrightarrow{\Delta^n} \underbrace{C \otimes \cdots \otimes C}_{n+1 \text{ times}} \xrightarrow{f} C$.

$g : \underbrace{C \otimes \cdots \otimes C}_{k+1 \text{ times}} \rightarrow C$: a \mathbb{K} -linear map with $k \geq n$

\implies The following general “*computation rule*” holds:

For any $x \in C$ and $1 \leq j \leq n+1$

$$\begin{aligned} & \sum g(x_1 \otimes \cdots \otimes x_{j-1} \otimes f(x_j \otimes \cdots \otimes x_{j+n}) \otimes x_{j+n+1} \otimes \cdots \otimes x_{k+n+1}) \\ &= \sum g(x_1 \otimes \cdots \otimes x_{j-1} \otimes \bar{f}(x_j) \otimes x_{j+1} \otimes \cdots \otimes x_{k+1}). \end{aligned}$$

Proof of computation rule

Proof.

$$\begin{aligned} & \sum g(x_1 \otimes \cdots \otimes x_{j-1} \otimes f(x_j \otimes \cdots \otimes x_{j+n}) \otimes x_{j+n+1} \otimes \cdots \otimes x_{k+n+1}) \\ &= g \circ (\text{Id}^{\otimes j-1} \otimes f \otimes \text{Id}^{\otimes k-j+1}) \circ \Delta^{k+n}(x) \\ &= g \circ (\text{Id}^{\otimes j-1} \otimes f \otimes \text{Id}^{\otimes k-j+1}) \circ (\text{Id}^{\otimes j-1} \otimes \Delta^n \otimes \text{Id}^{\otimes k-j+1}) \circ \Delta^k(x) \\ &= g \circ (\text{Id}^{\otimes j-1} \otimes (f \circ \Delta^n) \otimes \text{Id}^{\otimes k-j+1}) \circ \Delta^k(x) \\ &= g \circ (\text{Id}^{\otimes j-1} \otimes \bar{f} \otimes \text{Id}^{\otimes k-j+1}) \circ \Delta^k(x) \\ &= \sum g(x_1 \otimes \cdots \otimes x_{j-1} \otimes \bar{f}(x_j) \otimes x_{j+1} \otimes \cdots \otimes x_{k+1}). \end{aligned}$$

□

Chapter 2.

Duality between Algebras and Coalgebras

Review: Some linear algebra (I)

$V, V^* := \text{Hom}_{\mathbb{K}}(V, \mathbb{K})$: a \mathbb{K} -vector space & its dual space

$\langle \cdot, \cdot \rangle : V^* \times V \rightarrow \mathbb{K}$: the natural pairing, i.e., $\langle f, v \rangle := f(v)$

If $A \subseteq V$ then $A^\perp := \{f \in V^* \mid \langle f, v \rangle = 0, \forall v \in A\}$.

If $B \subseteq V^*$ then $B^\perp := \{v \in V \mid \langle f, v \rangle = 0, \forall f \in B\}$.

$\implies V^\perp = 0$ and $V^{*\perp} = 0$.

\implies If $\varphi : V \rightarrow W$ is a \mathbb{K} -linear map of \mathbb{K} -vector spaces,
then its *transpose* $\varphi^* : W^* \rightarrow V^*$ is uniquely defined by

$$\langle \varphi^*(g), v \rangle = \langle g, \varphi(v) \rangle \quad \text{for all } g \in W^* \text{ and } v \in V.$$

(Note that it is just $\varphi^* : W^* \rightarrow V^*$, $g \mapsto g \circ \varphi$.)

Review: Some linear algebra (II)

We define $\rho: V^* \otimes W^* \rightarrow (V \otimes W)^*$ by

$$\langle \rho(f \otimes g), v \otimes w \rangle := \langle f, v \rangle \langle g, w \rangle, \quad \forall f \in V^*, g \in W^*, v \in V, w \in W,$$

namely, $\rho(f \otimes g)(v \otimes w) := f(v)g(w)$.

\implies Recall that the map ρ is a canonical **injection**.

Moreover if one of V and W is **finite** dimensional,
then the map ρ becomes a \mathbb{K} -linear **isomorphism**.

The dual algebra of a coalgebra

Let (C, Δ, ϵ) be a coalgebra over \mathbb{K} and

$C^* = \text{Hom}_{\mathbb{K}}(C, \mathbb{K})$ be its dual space.

We can define $M : C^* \otimes C^* \rightarrow C^*$ and $u : \mathbb{K} \rightarrow C^*$ by

$M : C^* \otimes C^* \xrightarrow{\rho} (C \otimes C)^* \xrightarrow{\Delta^*} C^*$ and

$u : \mathbb{K} \xrightarrow{\cong} \mathbb{K}^* \xrightarrow{\epsilon^*} C^*$.

Proposition

1. (C^*, M, u) is an algebra over \mathbb{K} .
2. If $g : C \rightarrow D$ is a morphism of coalgebras then $g^* : D^* \rightarrow C^*$ is a morphism of algebras.

The dual coalgebra of a finite dimensional algebra

Let (A, M, u) be a **finite dimensional** algebra over \mathbb{K} and $A^* = \text{Hom}_{\mathbb{K}}(A, \mathbb{K})$ be its dual space.

In this case, the map $\rho : A^* \otimes A^* \rightarrow (A \otimes A)^*$ is **bijection**.

Thus we can define $\Delta : A^* \rightarrow A^* \otimes A^*$ and $\epsilon : A^* \rightarrow \mathbb{K}$ by

$$\Delta : A^* \xrightarrow{M^*} (A \otimes A)^* \xrightarrow{\rho^{-1}} A^* \otimes A^* \text{ and}$$

$$\epsilon : A^* \xrightarrow{u^*} \mathbb{K}^* \xrightarrow{\cong} \mathbb{K}.$$

Proposition

1. (A^*, Δ, ϵ) is a coalgebra over \mathbb{K} .
2. If $f : A \rightarrow B$ is a morphism of algebras then $f^* : B^* \rightarrow A^*$ is a morphism of coalgebras.

Categorical duality for finite dimensional case

(A, M, u) : a finite dimensional algebra

(C, Δ, ϵ) : a finite dimensional coalgebra

If V is a finite dimensional vector space, then recall that

$\mathcal{E} : V \rightarrow V^{**}$, $\mathcal{E}(v)(f) := f(v)$, $\forall v \in V, f \in V^*$ is an isomorphism.

Proposition

1. $\mathcal{E} : A \rightarrow A^{**}$ is an isomorphism of algebras;
2. $\mathcal{E} : C \rightarrow C^{**}$ is an isomorphism of coalgebras.

\implies The category **F Coalg** is anti-equivalent to the category **F Alg**.

Also, we have **F Cocomm.Coalg** $\xleftarrow[\text{anti}]{\cong}$ **F Comm.Alg**.

Sub-coalgebras of a coalgebra & its duality

Let (C, Δ, ϵ) be a coalgebra.

If V is a subspace of C that satisfies $\Delta(V) \subseteq V \otimes V$, then clearly $(V, \Delta|_V, \epsilon|_V)$ becomes a coalgebra and it is easy to check that the inclusion map $V \hookrightarrow C$ is a morphism of coalgebras.

This fact naturally leads to the following definition:

Definition

A subspace $V \subseteq C$ is called a *sub-coalgebra* if $\Delta(V) \subseteq V \otimes V$.

Proposition

1. If $V \subseteq C$ is a sub-coalgebra, V^\perp is a (two-sided) ideal of C^* .
2. If $J \subseteq C^*$ is a (two-sided) ideal, J^\perp is a sub-coalgebra of C .

Coideals of a coalgebra & its duality

Let (C, Δ, ϵ) be a coalgebra.

Definition

A subspace $V \subseteq C$ is called a (two-sided) *coideal* if

1. $\Delta(V) \subseteq V \otimes C + C \otimes V$;
2. $\epsilon(V) = 0$.

Proposition

1. If $V \subseteq C$ is a coideal, V^\perp is a subalgebra of C^* .
2. If $B \subseteq C^*$ is a subalgebra, B^\perp is a coideal of C .

Kernel and image for a morphism of coalgebras

Let $g : C \rightarrow D$ be a morphism of coalgebras.

Proposition

1. $\text{Ker } g$ is a coideal in C ;
2. $\text{Im } g$ is a sub-coalgebra in D .

If $J \subseteq C$ is a coideal, there is a unique coalgebra structure on C/J such that $\pi : C \rightarrow C/J$ is a morphism of coalgebras.

Homomorphism Theorem

If $J \subseteq \text{Ker } g$ is a coideal, there is a unique morphism of coalgebras $\bar{g} : C/J \rightarrow D$ such that $\bar{g} \circ \pi = g$. In particular, $C/\text{Ker } g \cong \text{Im } g$.

Left and right coideals of a coalgebra & its duality

Let (C, Δ, ϵ) be a coalgebra.

Definition

1. A subspace $V \subseteq C$ is called a *left coideal* if $\Delta(V) \subseteq C \otimes V$;
2. A subspace $V \subseteq C$ is called a *right coideal* if $\Delta(V) \subseteq V \otimes C$.

Proposition

1. If $V \subseteq C$ is a left (right) coideal, V^\perp is a left (right) ideal in C^* ;
2. If $J \subseteq C^*$ is a left (right) ideal, J^\perp is a left (right) coideal in C .

Caution!!

A coideal need not be either a left or a right coideal.

Furthermore, if $V \subseteq C$ is both a left and right coideal,

then V is a sub-coalgebra and not a coideal unless $V = 0$.

This is because $(V \otimes C) \cap (C \otimes V) = V \otimes V$.

(Or, simply, by duality.)

Chapter 3.

Bialgebras and Hopf Algebras

Review: The tensor product of two algebras is an algebra.

$(A, M_A, u_A), (B, M_B, u_B)$: algebras over \mathbb{K}

$T : A \otimes B \rightarrow B \otimes A$: the 'twist' map, i.e., $a \otimes b \mapsto b \otimes a$

We can define $M_{A \otimes B}$ by

$$M_{A \otimes B} : A \otimes B \otimes A \otimes B \xrightarrow{\text{Id} \otimes T \otimes \text{Id}} A \otimes A \otimes B \otimes B \xrightarrow{M_A \otimes M_B} A \otimes B.$$

Also, we can define $u_{A \otimes B}$ by

$$u_{A \otimes B} : \mathbb{K} \xrightarrow{\simeq} \mathbb{K} \otimes \mathbb{K} \xrightarrow{u_A \otimes u_B} A \otimes B.$$

Proposition

$(A \otimes B, M_{A \otimes B}, u_{A \otimes B})$ is an algebra.

The tensor product of two coalgebras is a coalgebra.

$(C, \Delta_C, \epsilon_C), (D, \Delta_D, \epsilon_D)$: coalgebras over \mathbb{K}

$T : C \otimes D \rightarrow D \otimes C$: the 'twist' map, i.e., $c \otimes d \mapsto d \otimes c$

We can define $\Delta_{C \otimes D}$ by

$$\Delta_{C \otimes D} : C \otimes D \xrightarrow{\Delta_C \otimes \Delta_D} C \otimes C \otimes D \otimes D \xrightarrow{\text{Id} \otimes T \otimes \text{Id}} C \otimes D \otimes C \otimes D.$$

Also, we can define $\epsilon_{C \otimes D}$ by

$$\epsilon_{C \otimes D} : C \otimes D \xrightarrow{\epsilon_C \otimes \epsilon_D} \mathbb{K} \otimes \mathbb{K} \xrightarrow{\cong} \mathbb{K}.$$

Proposition

$(C \otimes D, \Delta_{C \otimes D}, \epsilon_{C \otimes D})$ is a coalgebra.

Definition of bialgebras (bigebras)

Suppose there is a system $(H, M, u, \Delta, \epsilon)$ such that (H, M, u) is an algebra and (H, Δ, ϵ) is a coalgebra.

Proposition

The following are equivalent:

- (A) $M : H \otimes H \rightarrow H$ and $u : \mathbb{K} \rightarrow H$ are coalgebra morphisms;
- (B) $\Delta : H \rightarrow H \otimes H$ and $\epsilon : H \rightarrow \mathbb{K}$ are algebra morphisms.

Proof. See the diagrams in next page. □

Definition

$(H, M, u, \Delta, \epsilon)$ is called a *bialgebra* if one of (A) and (B) holds.

Convolution algebra: $\text{Hom}_{\mathbb{K}}(C, A)$

(A, M, u) : an algebra over \mathbb{K}

(C, Δ, ϵ) : a coalgebra over \mathbb{K}

$H := \text{Hom}_{\mathbb{K}}(C, A)$: the set of all \mathbb{K} -linear maps from C to A

We define so called the '*convolution product*' $*$: $H \otimes H \rightarrow H$ by

$$* : H \otimes H \hookrightarrow \text{Hom}_{\mathbb{K}}(C \otimes C, A \otimes A) \xrightarrow{\text{Hom}(\Delta, M)} H,$$

where the first map is a canonical injection, and

the second map $\text{Hom}(\Delta, M)$ is the composition map defined by

$$\text{Hom}(\Delta, M) : \varphi \mapsto M \circ \varphi \circ \Delta.$$

Identity element in the convolution algebra $\text{Hom}_{\mathbb{K}}(C, A)$

Similarly, $\epsilon : C \rightarrow \mathbb{K}$ and $u : \mathbb{K} \rightarrow A$ induce $\eta : \mathbb{K} \rightarrow H$ defined by

$$\eta : \mathbb{K} \cong \text{Hom}_{\mathbb{K}}(\mathbb{K}, \mathbb{K}) \xrightarrow{\text{Hom}(\epsilon, u)} H = \text{Hom}_{\mathbb{K}}(C, A),$$

where $\text{Hom}(\epsilon, u) : \varphi \mapsto u \circ \varphi \circ \epsilon$.

Consequently, we obtain the following result:

Proposition

1. $(\text{Hom}_{\mathbb{K}}(C, A), *, \eta)$ is an algebra over \mathbb{K} ;
2. The identity element in $\text{Hom}_{\mathbb{K}}(C, A)$ is $\eta(1_{\mathbb{K}}) = u \circ \epsilon$.

Definition of Hopf algebras

$(H, M, u, \Delta, \epsilon)$: a bialgebra over \mathbb{K}

Put $H^A := (H, M, u)$ and $H^C := (H, \Delta, \epsilon)$.

Definition

$(H, M, u, \Delta, \epsilon)$ is a *Hopf algebra* if $\text{Id}: H \rightarrow H$ has inverse $S: H \rightarrow H$ in the algebra $(\text{Hom}_{\mathbb{K}}(H^C, H^A), *, \eta)$. S is called the *antipode*.

In other words, there is $S: H \rightarrow H$ commuting the following diagram:

$$\begin{array}{ccccc} & & H \otimes H & \xrightarrow{S \otimes \text{Id}} & H \otimes H & & \\ & \nearrow \Delta & & & & \searrow M & \\ H & \xrightarrow{\epsilon} & \mathbb{K} & \xrightarrow{u} & H & & \\ & \searrow \Delta & & & & \nearrow M & \\ & & H \otimes H & \xrightarrow{\text{Id} \otimes S} & H \otimes H & & \end{array}$$

Examples of Hopf algebras (I)

Ex. 1. Group algebra

Let G be a group and $\mathbb{K}G$ be a group algebra over \mathbb{K} .

$\mathbb{K}G$ is a bialgebra if we endow $\mathbb{K}G$ with 'group-like coalgebra'.

$\mathbb{K}G$ is a Hopf algebra with $S : \mathbb{K}G \rightarrow \mathbb{K}G$, $g \mapsto g^{-1}$, $\forall g \in G$.

It is cocommutative, and it is commutative iff G is abelian.

Ex. 2. The set \mathbb{K}^G of all functions from a finite group G to \mathbb{K}

\mathbb{K}^G is an algebra with pointwise addition and multiplication

and a coalgebra with $\Delta(\varphi)(g, h) := \varphi(gh)$ and $\epsilon(\varphi) := \varphi(1_G)$.

\mathbb{K}^G is a Hopf algebra with $S(\varphi)(g) := \varphi(g^{-1})$.

It is commutative, and it is cocommutative iff G is abelian.

Examples of Hopf algebras (II)

Ex. 3. Tensor algebra & its families

Let $T(V) = \bigoplus_{j=0}^{\infty} V^{\otimes j}$ be a tensor algebra over a \mathbb{K} -space V .

If, for all $v \in V$, we define $\Delta(v) := 1 \otimes v + v \otimes 1$, $\epsilon(v) := 0$, and $S(v) := -v$, then $T(V)$ is a cocommutative Hopf algebra.

Symmetric algebra and Exterior algebra are Hopf algebras.

Ex. 4. Universal enveloping algebra of a Lie algebra

Let $U(\mathfrak{g})$ be a U.E.A. of a Lie algebra \mathfrak{g} over \mathbb{K} .

If, for all $X \in \mathfrak{g}$, we define $\Delta(X) := 1 \otimes X + X \otimes 1$, $\epsilon(X) := 0$, and $S(X) := -X$, then $U(\mathfrak{g})$ is a cocommutative Hopf algebra.

It is commutative if and only if \mathfrak{g} is abelian.

Examples of Hopf algebras (III)

Ex. 5. SWEEDLER's 4-dimensional Hopf algebra

Assume that $\text{char } \mathbb{K} \neq 2$.

If H is generated as an algebra by c and x by the relations

$$c^2 = 1, \quad x^2 = 0, \quad xc = -cx,$$

then H is a 4-dimensional \mathbb{K} -space with basis $\{1, c, x, cx\}$.

The coalgebra structure of H is defined by

$$\Delta(c) := c \otimes c, \quad \Delta(x) := c \otimes x + x \otimes 1, \quad \epsilon(c) := 1, \quad \epsilon(x) := 0.$$

If $S(c) := c^{-1}$, $S(x) := -cx$, then H is a Hopf algebra.

This is the **smallest** example which is both **non-commutative** and **non-cocommutative**.

Chapter 4.

Duality between

Linear Algebraic Groups and Hopf Algebras

From now on,

we suppose that \mathbb{K} is algebraically closed.

Linear algebraic groups (=Affine algebraic groups)

Definition

An *algebraic group* G is an *algebraic variety* (over \mathbb{K}) which is also a *group* such that the maps defining the group structure $\mu : G \times G \rightarrow G, (g, h) \mapsto gh$ and $\iota : G \rightarrow G, g \mapsto g^{-1}$ are *morphisms of varieties*. (Here, $G \times G$ is the product of varieties.)

Definition

An algebraic group is called *linear* if the underlying variety is *affine*.

Definition

A *homomorphism* $G \rightarrow G'$ of algebraic groups is defined as a *variety morphism* which is also a *group homomorphism*.

Review: HILBERT's Nullstellensatz

In algebraic geometry, there is a well-known (anti-)correspondence between algebra and geometry via Nullstellensatz.

Geometry	\leftrightarrow	Algebra
Affine variety V	\leftrightarrow	Affine algebra $\mathbb{K}[V]$
Points in V	\leftrightarrow	Maximal ideals in $\mathbb{K}[V]$
Irr. closed sub-varieties of V	\leftrightarrow	Prime ideals in $\mathbb{K}[V]$
Variety morphism $V_1 \rightarrow V_2$	\leftrightarrow	Algebra morphism $\mathbb{K}[V_2] \rightarrow \mathbb{K}[V_1]$
(Categorical) Product $V_1 \times V_2$	\leftrightarrow	Coproduct $\mathbb{K}[V_1] \otimes \mathbb{K}[V_2]$
Combinatorial dimension	\leftrightarrow	Krull Dimension
\vdots	\vdots	\vdots

Duality between linear algebraic groups & Hopf algebras

Linear algebraic groups G \leftrightarrow (comm.) Hopf algebra $\mathbb{K}[G]$

Affine variety G \leftrightarrow Affine algebra $\mathbb{K}[G]$

Map $G_1 \rightarrow G_2$ \leftrightarrow Map $\mathbb{K}[G_2] \rightarrow \mathbb{K}[G_1]$

(Categorical) Product $G \times G$ \leftrightarrow Coproduct $\mathbb{K}[G] \otimes \mathbb{K}[G]$

$\mu : G \times G \rightarrow G$ \leftrightarrow $\mu^0 = \Delta : \mathbb{K}[G] \rightarrow \mathbb{K}[G] \otimes \mathbb{K}[G]$

$\iota : G \rightarrow G$ \leftrightarrow $\iota^0 = S : \mathbb{K}[G] \rightarrow \mathbb{K}[G]$

Associativity of μ $\xleftrightarrow{\text{Ax.1}}$ Coassociativity of Δ

Existence of identity $\xleftrightarrow{\text{Ax.2}}$ Counitary property

Existence of inverse $\xleftrightarrow{\text{Ax.3}}$ Antipodal property

For $(\mathbb{K}[G], M, u, \Delta, \epsilon, S)$, $M(\varphi, \psi)(g) = \varphi(g)\psi(g)$, $u(1_{\mathbb{K}}) = 1_{\mathbb{K}}$,

$\Delta(\varphi)(g, h) = \varphi(gh)$, $\epsilon(\varphi) = \varphi(1_G)$, and $S(\varphi)(g) = \varphi(g^{-1})$.

Put $A := \mathbb{K}[G]$ and $M^0 = \text{diag} : G \rightarrow G, g \mapsto (g, g)$.

$$\begin{array}{ccc} G \times G \times G & \xrightarrow{\text{Id} \times \mu} & G \times G \\ \mu \times \text{Id} \downarrow & & \downarrow \mu \\ G \times G & \xrightarrow{\mu} & G \end{array}$$

Ax.1

$$\begin{array}{ccc} A \otimes A \otimes A & \xleftarrow{\text{Id} \otimes \Delta} & A \otimes A \\ \Delta \otimes \text{Id} \uparrow & & \uparrow \Delta \\ A \otimes A & \xleftarrow{\Delta} & A \end{array}$$

$$\begin{array}{ccc} G & \xrightarrow{\text{Id}} & G \\ \text{Id} \downarrow & \searrow \mu & \downarrow g \mapsto (1_G, g) \\ G & \xrightarrow{g \mapsto (g, 1_G)} & G \times G \end{array}$$

Ax.2

$$\begin{array}{ccc} A & \xleftarrow{\simeq} & \mathbb{K} \otimes A \\ \simeq \uparrow & \searrow \Delta & \uparrow \epsilon \otimes \text{Id} \\ A \otimes \mathbb{K} & \xleftarrow{\text{Id} \otimes \epsilon} & A \otimes A \end{array}$$

$$\begin{array}{ccc} G \times G & \xrightarrow{\iota \times \text{Id}} & G \times G \\ \text{diag} \nearrow & & \searrow \mu \\ G & \xrightarrow{g \mapsto 1_{\mathbb{K}}} & \mathbb{K} \xrightarrow{1_{\mathbb{K}} \mapsto 1_G} G \\ \text{diag} \searrow & & \nearrow \mu \\ G \times G & \xrightarrow{\text{Id} \times \iota} & G \times G \end{array}$$

Ax.3

$$\begin{array}{ccc} A \otimes A & \xleftarrow{S \otimes \text{Id}} & A \otimes A \\ M \swarrow & & \searrow \Delta \\ A & \xleftarrow{u} & \mathbb{K} \xleftarrow{\epsilon} A \\ M \swarrow & & \searrow \Delta \\ A \otimes A & \xleftarrow{\text{Id} \otimes S} & A \otimes A \end{array}$$

Final comment:

The study of 'Quantum groups' (they are some kind of Hopf algebras) is a study for deformation of this duality between linear algebraic groups and Hopf algebras.

Thank you for your attention!
